PROFILE

Final-year B.Tech Computer Science (AI & ML) student with hands-on experience designing data pipelines, cloud analytics infrastructure, and Medallion Lakehouse architectures through self-driven and academic projects. Comfortable working across Python, PySpark, SQL, and AWS to build reliable, well-tested data workflows, with a growing interest in applying AI/LLM tooling to data and business-intelligence problems. Looking to bring this foundation into a Data Engineering role and keep building on it in a production setting.

EDUCATION

Bachelor of Technology in Computer Science (AI & ML)

Vellore Institute of Technology (VIT), Bhopal | 2023 – 2027 | CGPA: 8.43

TECHNICAL SKILLS

Data Engineering & Cloud: Apache Spark (PySpark), AWS (S3, Glue, Athena), Apache Airflow, PostgreSQL, Terraform (IaC), Docker

Languages: Python, SQL, C++

Data Quality & Analytics: Great Expectations, Pandas, Streamlit, Plotly

AI & Machine Learning: LLM API Integration, Prompt Engineering, PyTorch, Scikit-Learn

PROJECTS

AlphaLake — Financial Market Data Lakehouse & Analytics Platform [GitHub](#) [Live Demo](#)

Technologies: Python, PySpark, AWS (S3, Glue, Athena), Airflow, Terraform, Great Expectations

- Designed a Medallion Data Lakehouse (Bronze, Silver, Gold) to ingest and process high-throughput financial market and order-flow event data, using SHA-256 integrity checksums and trade_date partitioning.
- Built automated data-quality validation pipelines with Great Expectations v1.x, including quarantine routing for anomalous records and schema-drift detection to keep invalid data out of downstream layers.
- Implemented distributed PySpark window transformations to compute rolling technical indicators, achieving a 3.05x speedup over an equivalent Pandas baseline.
- Provisioned the underlying AWS analytics infrastructure with Terraform (IaC) and orchestrated scheduled workflows using Apache Airflow DAGs.
- Developed a 6-page interactive Streamlit & Plotly analytics portal to visualize market performance and pipeline health telemetry.

SupplyGuard — AI-Powered Supplier Intelligence Platform [GitHub](#) [Live Demo](#)

Technologies: Python, Streamlit, LLM APIs, Pandas, Plotly

- Built an AI-assisted analytics platform to evaluate supplier performance, using a rule-based health-scoring engine across delivery, quality, and payment metrics.
- Integrated an LLM API to generate automated supplier communication drafts and business recommendations from structured risk data.
- Developed the data ingestion and preprocessing pipeline powering interactive risk-visualization dashboards.

AWARDS & ACHIEVEMENTS

- Top 11 Finalist (out of 600+), Innovatez GenZ Hackathon 2026 (Zentiti) — pitched the SupplyGuard MVP. [View](#)
